

# STAHLY STRONGER TANKS

- 1** **2** Press formed heads with a #4 polished finish.
- 3** **4** Two internal baffles provide much more stability. Dished heads are used instead of flat plate for added strength.
- 5** **6** Longitudinal welded seams are stronger than one weld around the the center of a tank. Four longitudinal seams, five around the circumference and five dished heads provide the durability required for the toughest conditions.
- 7** 100 gallon internal rinse tank in the front of our tank with fittings for a hand washer or pressure washer. Top sparger provides a complete rinse of all internal surfaces.
- 8** We specify a 33% thicker 3/16" skid and a one piece continuous sill our tanks hold up in the roughest terrain.
